

CLAIMS

What is claimed is:

- 1 1. A system for replicating data over a network, comprising:
 - 2 a. a master server containing an original copy of the data, said
 - 3 master server comprising:
 - 4 i. a master user layer adapted to start a data replication
 - 5 process by calling a start method, the master user
 - 6 layer further adapted to send information relating to
 - 7 the original copy of the data;
 - 8 ii. a master service layer containing the start method
 - 9 and adapted to receive the call from the master user
 - 10 layer and the information relating to the original copy
 - 11 of the data, the master service layer further adapted
 - 12 to create and send a data replication packet
 - 13 containing at least some of the information relating to
 - 14 the original copy of the data;
 - 15 b. a slave server adapted to store a copy of the data from the
 - 16 master server, the slave server comprising:
 - 17 i. a slave service layer adapted to receive the data
 - 18 replication packet from the master service layer and
 - 19 process the data replication packet, the slave service
 - 20 layer further adapted to send information relating to
 - 21 the data replication packet; and

22 ii. a slave user layer adapted to receive the information
23 relating to the data replication packet from the slave
24 service layer, the slave user layer adapted to store the
25 information in the data replication packet.

1 2. A system according to claim 1, wherein said master user layer is in
2 communication with at least one of a master user and a master user
3 device.

1 3. A system according to claim 1, wherein said master user layer is
2 adapted to send information relating to the original copy of the data
3 in the form of a delta, the delta containing information relating to
4 changes between a previous state and the current state of the
5 original copy of the data.

1 4. A system according to claim 1, wherein said master user layer is
2 adapted to update the original copy of the data.

1 5. A system according to claim 1, wherein said master user layer is
2 adapted to send a roll-back message indicating that a change to the
3 original copy of the data should not be replicated on a slave server.

1 6. A system according to claim 1, wherein said master user layer is

2 adapted to set a timeout value for the replication.

1 7. A system according to claim 1, wherein said master user layer is
2 adapted to create a delta between the present state of the original
3 copy of the data and the prior state of the original copy of the data.

1 8. A system according to claim 1, wherein said master user layer is
2 adapted to create a delta between the present state of the original
3 copy of the data and a previous state of the original copy of the
4 data.

1 9. A system according to claim 1, wherein said master user layer is
2 adapted to generate a unique version number for each state of the
3 original copy of the data.

1 10. A system according to claim 1, wherein said master service layer is
2 adapted to multicast the data replication packet.

1 11. A system according to claim 1, wherein said master service layer is
2 adapted to heartbeat the data replication packet.

1 12. A system according to claim 1, wherein said master service layer is
2 adapted to include a version number in the data replication packet.

1 13. A system according to claim 1, wherein said master service layer is
2 adapted to include information necessary to update the copy of the
3 data on the slave server to the current state of the original copy of
4 the data.

1 14. A system according to claim 1, wherein said master service layer is
2 further adapted to create and send a data replication packet
3 comprising a delta.

1 15. A system according to claim 1, wherein said master service layer is
2 further adapted to create and send a data replication packet
3 comprising a delta between successive states of the original copy
4 of the data.

1 16. A system according to claim 1, wherein said master service layer is
2 further adapted to create and send a data replication packet
3 comprising a delta between arbitrary states of the original copy of
4 the data.

1 17. A system according to claim 1, wherein said master service layer is
2 adapted to request a delta from the master user layer.

- 1 18. A system according to claim 1, wherein said master service layer is
2 adapted to send a commit message to a slave service layer.
- 1 19. A system according to claim 1, wherein said master service layer is
2 adapted to heartbeat a commit message to a slave service layer.
- 1 20. A system according to claim 1, wherein said master service layer is
2 adapted to multicast a commit message to a slave service layer.
- 1 21. A system according to claim 1, wherein said master service layer is
2 adapted to send an abort message to a slave service layer.
- 1 22. A system according to claim 1, wherein said master service layer is
2 adapted to heartbeat an abort message to a slave service layer.
- 1 23. A system according to claim 1, wherein said master service layer is
2 adapted to multicast an abort message to a slave service layer.
- 1 24. A system according to claim 1, wherein said slave user layer is in
2 communication with at least one of a slave user and a slave user
3 device.
- 1 25. A system according to claim 1, wherein said slave user layer is

2 adapted to check the current version number of data stored on the
3 slave server.

1 26. A system according to claim 1, wherein said slave user layer is
2 adapted to commit information relating to the data replication packet
3 to the data stored on the slave server.

1 27. A system according to claim 1, wherein said slave user layer is
2 adapted to abort an update to the data stored on the slave server.

1 28. A system according to claim 1, wherein said slave user layer is
2 adapted to process a prepare request contained in the data
3 replication packet.

1 29. A system according to claim 1, wherein said slave user layer is
2 adapted to send a response to the slave service layer relating to a
3 prepare request contained in the data replication packet.

1 30. A system according to claim 1, wherein said slave user layer is
2 adapted to persistently cache data on a local disk.

1 31. A system according to claim 1, wherein said slave user layer is
2 adapted to update the version number of the copy of the data on the

3 slave server.

1 32. A system according to claim 1, wherein said slave service layer is
2 adapted to request a delta from the master service layer.

1 33. A system according to claim 1, wherein said slave service layer is
2 adapted to request the current version number of the data stored on
3 the slave server from the slave user layer.

1 34. A system according to claim 1, wherein said slave service layer is
2 adapted to send a commit message to the slave user layer.

1 35. A system according to claim 1, wherein said slave service layer is
2 adapted to send an abort message to the slave user layer.

1 36. A method for replicating data from a master server to a slave server,
2 comprising:

3 a. sending a start call from a master user level to a master
4 service level on a master server, the start call containing
5 information relating to the current state of master data on the
6 master server;

7 b. sending the information to a slave service layer on a slave
8 server, the slave service layer adapted to check a slave user

- 9 layer on the slave server to determine whether slave data on
10 the slave server has the current state;
11 c. sending a request for a delta from the slave service layer to
12 the master service layer, the master service layer adapted to
13 request and receive a delta from the master user layer;
14 d. sending a delta from the master service layer to the slave
15 service layer, the delta containing the information necessary
16 to bring the slave data up to the current state, the slave
17 service layer adapted to process the delta and send the
18 information to the slave user layer; and
19 e. updating the slave data using the slave user layer.

- 1 37. A method according to claim 36, further comprising:
2 determining a version number for the current state of the data using
3 the master user layer.

- 1 38. A method according to claim 36, further comprising:
2 sending the information to the slave service layer by multicasting.

- 1 39. A method according to claim 36, further comprising:
2 sending information to the slave service layer, the information
3 comprising a version number for the current state of the master data.

- 1 40. A method for replicating data from a master server to a slave server,
2 comprising:
- 3 a. sending a new delta from a master user level to a master
4 service level on a master server, the delta containing
5 information relating to a change from the prior state to the
6 current state in master data stored on the master server;
- 7 b. sending the new delta from the master service layer to a
8 slave service layer on a slave server, the slave service layer
9 adapted to check a slave user layer on the slave server to
10 determine whether the slave data on the slave server has the
11 current state;
- 12 c. sending a request for a syncing delta from the slave service
13 layer to the master service layer, the master service layer
14 adapted to request and receive a syncing delta from the
15 master user layer, the syncing delta containing information
16 necessary to update the slave data to the prior state of the
17 master data;
- 18 d. sending the syncing delta from the master service layer to
19 the slave service layer, the slave service layer adapted to
20 process the delta and send the information to the slave user
21 layer to be committed to the slave data; and
- 22 e. committing the information in the new delta to the slave data
23 using the slave user layer.

- 1 41. A method for replicating data from a master server to a slave server
2 over a network, the method comprising the steps of:
3 a. sending a version number from a master service layer to a
4 slave service layer relating to the present state of the original
5 copy of the data on the master server;
6 b. allowing a slave user layer to determine whether the data on
7 the slave server has been updated to correspond to
8 the version number; and
9 c. requesting a delta be sent from the master service layer to
10 the slave service layer if the data on the slave server does
11 not correspond to the version number.

- 1 42. A method according to claim 36, further comprising:
2 allowing the slave user layer to persistently cache the data on a
3 local disk for each slave server.

- 1 43. A method according to claim 36, further comprising:
2 allowing the master user layer to determine a unique version
3 number for the current state of the data on the master server.

- 1 44. A method according to claim 36, further comprising:
2 including data with the version number that is necessary for a slave

3 user layer to update the data on a slave server.

1 45. A method according to claim 36, further comprising:
2 committing the data necessary to update the slave server as soon
3 as it is received by the slave user layer.

1 46. A method for replicating data over a network including a master
2 server and at least one slave server, the method comprising the
3 steps of:

4 a. sending a packet of information from a master service layer
5 to a slave service layer on each slave server on the network,
6 the information relating to a change in the data stored on the
7 master server and containing a prior version number for the
8 prior state and a new version number for the new state of the
9 data, the information further relating to previous changes in
10 the data and a previous version number for each previous
11 change;

12 b. allowing a slave user layer on each slave server to determine
13 whether the data on the slave server corresponds to the prior
14 version number contained in the packet;

15 c. allowing each slave user layer to commit the packet of
16 information if the data on the slave server corresponds to the
17 prior version number contained in the packet, the commit

18 also updating the version of the slave server to the new
19 version number; and
20 d. allowing each slave user layer not corresponding to the prior
21 version number to request that a delta be sent from the
22 master service layer to the slave service layer corresponding
23 to that slave user layer, the delta containing the information
24 necessary to update the slave to the prior version number
25 before the slave service layer commits the packet of
26 information.

1 47. A method for replicating data from a master server to at least one
2 slave server over a network, the method comprising the steps of:
3 a. sending a packet of information from a master service layer
4 on the master server to the user service layer on a slave
5 server, the information relating to a change in the data stored
6 on the master server and containing a version number for the
7 present state of the data;
8 b. allowing the slave user layer on the server to determine
9 whether the slave server has been updated to correspond to
10 the version number contained in the packet, and to further
11 determine whether the slave user layer can process the
12 packet of information if needed to update to correspond to
13 the version number contained in the packet;

- 14 c. sending a signal from the slave service layer to the master
15 service layer, the signal indicating whether the slave server
16 needs to be updated and whether the slave server can
17 process the update;
18 d. sending a response signal from the master service layer to
19 the slave service layer indicating whether the slave user layer
20 should commit to the information contained in the packet;
21 and
22 e. committing the packet of information to the slave server if so
23 indicated by the response signal.

- 1 48. A computer-readable medium, comprising:
2 a. means for sending a version number from a master service layer
3 to a slave service layer relating to the present state of the
4 original copy of the data on the master server;
5 b. means for allowing a slave user layer to determine whether the
6 data on the slave server has been updated to correspond to
7 the version number; and
8 c. means for requesting a delta be sent from the master service
9 layer to the slave service layer if the data on the slave server
10 does not correspond to the version number.

- 1 49. A computer program product for execution by a server computer for

2 replicating data from a master server to a slave server over a network,
3 comprising:

- 4 a. computer code for sending a version number from a master
5 service layer to a slave service layer relating to the present
6 state of the original copy of the data on the master server;
7 b. computer code for allowing a slave user layer to determine
8 whether the data on the slave server has been updated to
9 correspond to the version number; and
10 c. computer code for requesting a delta be sent from the master
11 service layer to the slave service layer if the data on the
12 slave server does not correspond to the version number.

- 1 50. A system for replicating data over a network, comprising:
2 a. means for sending a version number from a master service layer
3 to a slave service layer relating to the present state of the
4 original copy of the data on the master server;
5 b. means for allowing a slave user layer to determine whether the
6 data on the slave server has been updated to correspond to
7 the version number; and
8 c. means for requesting a delta be sent from the master service
9 layer to the slave service layer if the data on the slave server
10 does not correspond to the version number.

- 1 51. A computer system comprising:
- 2 a processor;
- 3 object code executed by said processor, said object code configured
- 4 to:
- 5 a. send a version number from a master service layer to a
- 6 slave service layer relating to the present state of the
- 7 original copy of the data on the master server;
- 8 b. allow a slave user layer to determine whether the data on
- 9 the slave server has been updated to correspond to
- 10 the version number; and
- 11 c. request a delta be sent from the master service layer to
- 12 the slave service layer if the data on the slave server
- 13 does not correspond to the version number.
